

Mensuração de Ordenação

Trabalho de Estruturas de Dados

Alunos: Diego dos Santos Fernandes e Ueslei Albuquerque Garcia

Introdução

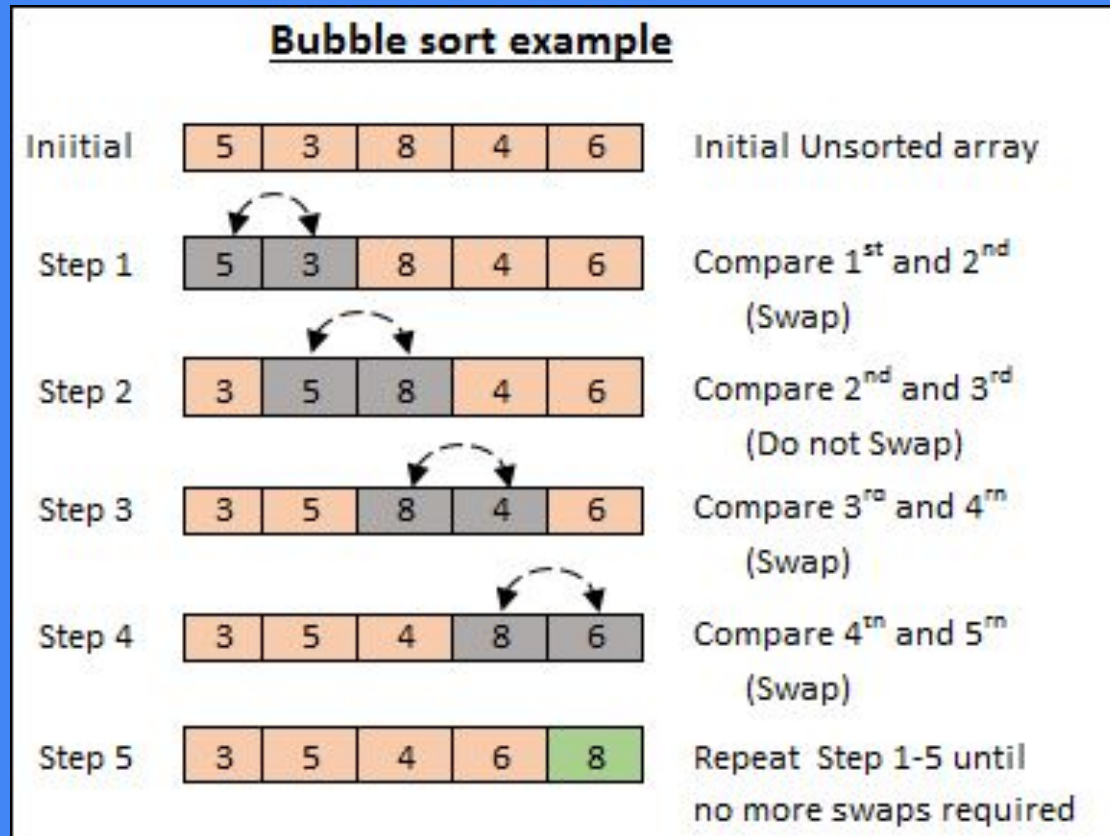

Porque é a ordenação é importante?

- Redução de complexidade de problemas em seu código

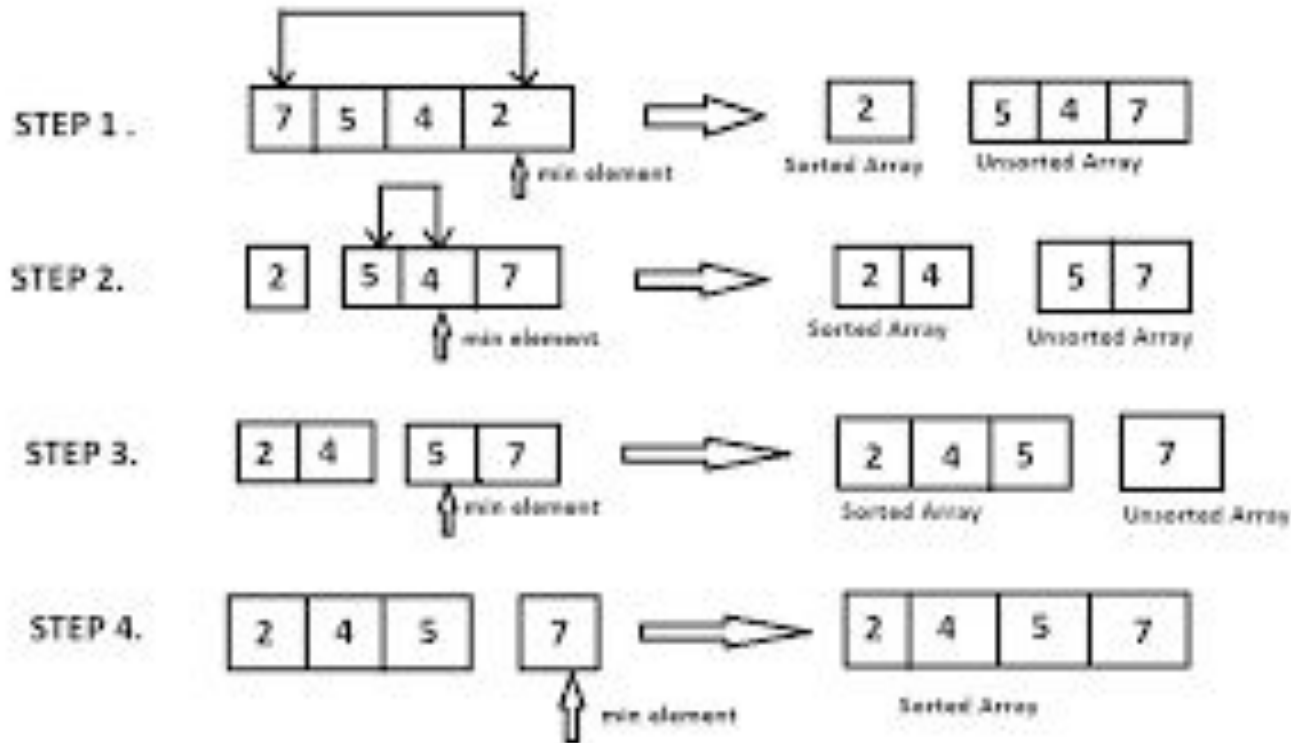

Quais suas vantagens ou desvantagens?

- Quanta memória tem disponível para uso?
- A coleção deve crescer?
- Qual o tamanho da coleção a ser ordenada?
- Quais os requisitos de sistema e limitação antes de decidir qual algoritmo utilizar?
- Tem que ser utilizado em curto, médio ou longo tempo

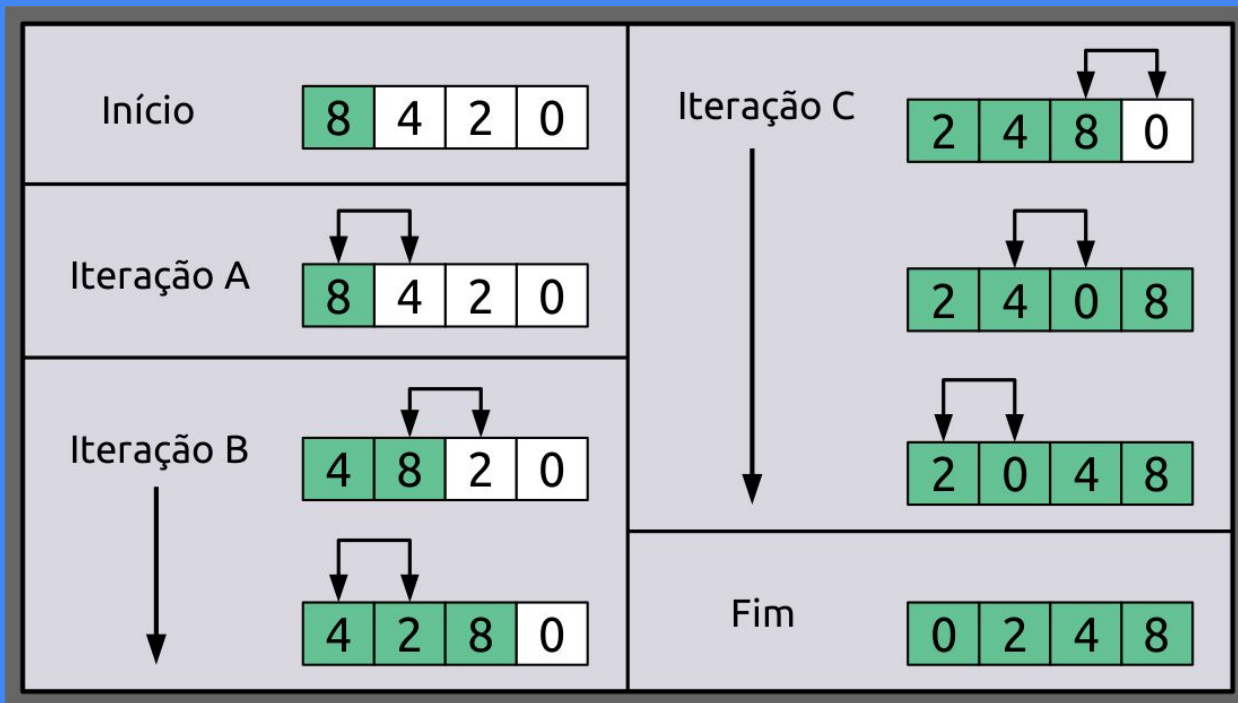

Ordenação do método em bolha

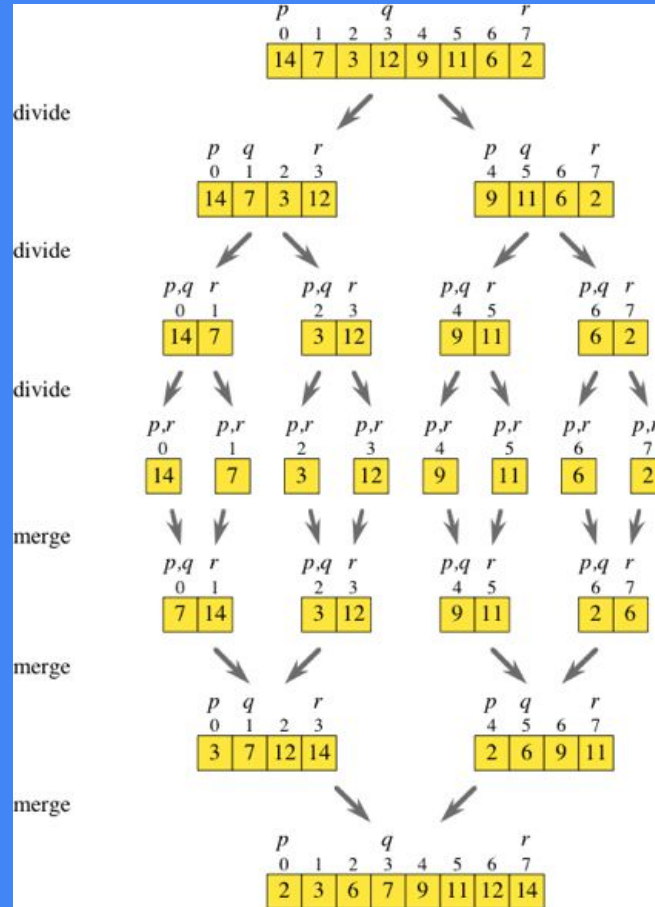

Ordenação do método de seleção

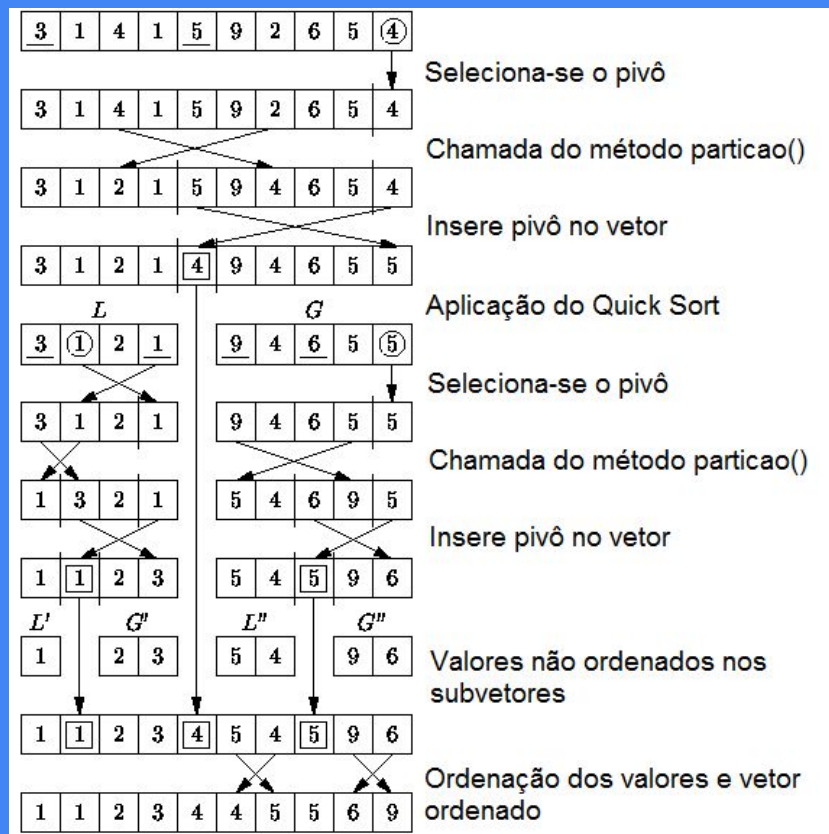

Ordenação do método de inserção

Ordenação do método de intercalação

Ordenação do método rápido

Ordenação do método de pilha

| | | | | | | | |

| | 0 | 1 | 2 | 3 | 4 | 5 | 6 |

Initial Elements

Max Heap

Casos de teste (tempo de execução e seu gráfico de média aritmética)

- Caso de teste 1: Você deve gerar um arquivo de teste que contenha 1 milhão de números de 1 a 99999. Os valores devem estar arranjados de maneira aleatória.
- Caso de teste 2: Você deve gerar um arquivo de teste que contenha 750 mil números com valores entre 1 e 99999. Os valores devem estar arranjados em ordem crescente.
- Caso de teste 3: Você deve gerar um arquivo de teste que contenha 750 mil números com valores entre 1 e 99999. Os valores devem estar arranjados em ordem decrescente.
- Caso de teste 4: Você deve gerar um arquivo de teste que contenha 500 mil números com valores entre 1 e 99999. Os valores devem estar arranjados parcialmente em ordem decrescente, ou seja, entre 250 e 1000 números deverão estar fora de ordem.

Configurações de hardware

- Cpu: Intel Pentium N5000 1.20 ghz
- Núcleos: 4
- Threads: 4
- Placa mãe: Dell inspiron 15
- Memória RAM: 4 GB DDR4 1300 MHz frequência
- Placa de Vídeo(Integrada): Intel UHD Graphics 605

```

Ordenação da primeira entrada

Ordenação da segunda entrada

Ordenação da terceira entrada

Ordenação da quarta entrada

Conclusão

- Uso de memória RAM e CPU no máximo mesmo com VB ativado(núcleo duplo para folga de cache)
- Teve uso de somente um núcleo sem distribuição para aliviar cache de memória
- Teste feitos com programas de inicialização e segundo plano fechados para não dar interferência no resultado
- Método de ordenação rápida se sobressai aos demais métodos
- Demorou mais da metade de um dia para terminar os teste tirando o fato que foi feito um teste anteriormente enquanto jogava jogo e fala no discord com navegador aberto em segundo plano
- Segundo teste foi feito com Wallpaper Engine em segundo plano houve uma possível interferência de resultado
